

E-COMMERCE SALES VISUALIZATION REPORT

Data Analytics Internship Milestone Submission — Task 4

Prepared By:	Data Analyst Intern	Date:	June 2026
Position:	Data Analytics Intern	Project Status:	Completed & Submitted

1. Executive Summary

Yeh report DecodeLabs Industrial Analytics Internship ke **Task 4 (E-Commerce Sales Visualization Project)** ki exhaustive submission hai. Is investigation ka primary objective 1,200 commercial operations data rows ko process aur analyze karna hai. Python scientific stack (`Pandas` , `NumPy` , `Matplotlib` , aur `Seaborn`) ka use karte hue raw categorical aur monetary structural values ko pipeline kiya gaya hai taake functional business intelligence map ki ja sake. Is framework ka dynamic goal stakeholder departments ko accurate metrics alignment provide karna hai taake warehouse logistics, conversion tracking, aur checkout structures ko data-backed updates diye ja sakein.

2. Key Performance Indicators (Financial Dashboard Summary)

Data filtering layers execute karne ke baad primary structural financial KPIs aur descriptive constants niche diye gaye aggregate cards matrix ke mutabiq populate hue hain:

1,200	\$148,450.00	\$123.70	945
TOTAL ORDERS	GROSS REVENUE	AVERAGE ORDER VALUE	ACTIVE CUSTOMERS

3. Data Cleaning & Preparation Pipeline (ETL Architecture)

Business calculation inconsistencies aur structural biases ko completely eliminate karne ke liye automated ETL routines code-level par verify kiye gaye:

- Duplicate Elimination:** Redundant tracking logs ko locate karke Python runtime pipeline mein `.drop_duplicates()` code sequence se clean kiya gaya taake metric calculations bias-free rahein.
- Null-Value Audit:** Systematic column structures par `.isnull().sum()` algorithm run kiya gaya, jisne essential data coordinates (`CustomerID` , `TotalPrice`) mein zero attribute loss output diya.
- Datetime Normalization:** Raw chaotic timestamps columns ko standard standardized Pandas format variable sets mein parse kiya gaya.

- **Feature Engineering** **ADDED**: Analytical time-series tracking zones construct karne ke liye linear date matrices se `Year` , `Month` , aur `Quarter` intervals isolate kiye gaye.

4. Strategic Visualization Framework Breakdown

Engineered dataset parameters ko graphical visibility matrix me transform karne ke liye multi-dimensional plots map kiye gaye hain:

Visualization Domain	Core Analytical Mapping & Objective	Operational Impact Strategy
Revenue by Product Category	Isolate product sales vectors via breakdown metrics. Top-performing high-margin SKUs manage over 40% of corporate turnover.	Supply Chain department inventory spend ratios ko dynamically align aur high-turnover materials par stream kar sakta hai.
Logistical Fulfillment	Plot distributions across absolute 'OrderStatus' features to scan leakage points.	Maximum metrics 'Delivered' rates confirm karte hain. Cancelled/Returned anomalies negligible hain, jo high operational stability signal karti hain.
Checkout & Payment Gateways	Frequency counting of active 'PaymentMethod' features. Customers show massive bias towards Digital Wallets & Cards.	Product management teams interface updates focused rkh skti hain taake transactional friction and cart abandonment minimize ho ske.
Monthly Sales Trend Line	Time-series regression arrays scanning regular seasonal transaction waves.	Growth performance metrics allow marketing networks to schedule digital promotional budgets exactly before peak intervals.
Referral Channel ROI	Evaluate total monetization performance maps grouped by active acquisition filters.	Google organic algorithms aur Instagram highly converting acquisition nodes verify hue hain, optimizing exact spend returns.

Statistical Variance Note **ADDED**: Multi-variable aggregation loops verify karte hain ke high-value basket orders core revenue contribution channels ko stable rakh rahe hain, jo market validation scales ko completely pass karta hai.

5. Data-Driven Business Recommendations **ENHANCED**

1. **Warehouse & Supply Chain Optimization:** Top revenue-driving items ke liye warehouse units mein continuous buffers aur safety stock ratios establish kiye jayein taake high purchase traffic seasons mein demand blocks breakdown na hon.

2. **Acquisition Capital Scaling:** Low conversion rate channels ke customer acquisition costs (CAC) allocations freeze karke directly top conversion vectors (Instagram Ads and Google SEO indexing) par re-route kiya jaye.
3. **Customer Lifetime Value (CLV) Engine:** Data systems mein top-tier frequent shoppers layer extract karke direct loyalty perks aur priority ticketing tracks establish kiye jayein, ensuring long-term revenue safety nets.
4. **Fulfillment & Logistics Integrity** ADDED: Fulfillment performance pipelines ko cross-verify kiya jaye taake future scale operations par standard delivery speed metrics secure rahen aur logistics leakage control ho ske.

6. Automation Pipeline & Conclusion

Yeh project raw transactional records ko dynamic, production-ready visualization asset mein change karta hai. Script engines input data formatting pipelines ko clean karke graphical outputs safely matrix maps me output karte hain. Tamam validation modules aur summaries parameters complete standard checks pass kar chuke hain aur pipeline executive level presentation ke liye fully authentic hai.
